

# Bridging the gaps between health & social care

## Incorporate non-clinical care factors into your care to help identify at-risk populations

Determinants of health include the range of personal, social, economic and environmental factors that influence health status

# 80%

of what impacts a person's health are non-clinical factors<sup>1</sup>

## How Cerner helps you address determinants of health

### Collecting relevant social determinants data at the point of care

Utilize evidence-based screening tools to collect relevant social risk data at the point of care with multiple screening assessments designed to fit your workflows and patient needs.

### Mapping goals and activities within a patient's longitudinal care plan

PRAPARE and WellRx assessments suggest and surface goals and activities within a patient's longitudinal care plan.

### Identifying community vulnerabilities and patient risk factors

Leverage the determinants of health analytics dashboard — which combines geospatial capabilities, the CDC's Social Vulnerability Index and clinical data — to view vulnerabilities at a population level, by census tract and the patient level.
